TEKREVOL

AI-NATIVE
SOFTWARE
DEVELOPMENT

DELIVERY FRAMEWORK

The Strata Method

EXPLORE FAST. SHIP DELIBERATELY.

What this is: a proposed signature framework for how TekRevol delivers software with AI. It is meant to set TekRevol apart on the website, in proposals and in AI search answers.

1. Why TekRevol needs its own framework

Competitors have started naming how they deliver with AI. A named method gives buyers something to remember, gives a champion something to take to leadership, and gives AI engines a definition to quote.

Competitor	Framework	Shape
HatchWorks	**GenDD** (Generative-Driven Development), with a manifesto, an ebook and a 2026 award	A straight line: Decide, Build, Adopt
Cheesecake Labs	**AI-Accelerated Delivery**, described as an agentic software lifecycle	Agent and human pairs at each step ("Agents propose, human prioritizes")
BluTech	No delivery method. Stage labels for its AI product (Understand, Orchestrate, Execute)	Short flows per service
Azumo, LeewayHertz	Nothing named for delivery	n/a

The gap

- **Every competitor framework is a straight line.** None separates exploring from shipping. That is exactly where AI-built software breaks: AI makes a demo cheap, but production still takes engineering
- **Nobody names the gate.** No one says when a prototype becomes production work, or what it has to pass
- **Nobody shows compounding.** No one shows how one build makes the next one better
- "Humans plus AI agents" is already expected. Cheesecake Labs owns that line, so TekRevol should not lead with it

2. The Strata Method

DEFINITION

> The Strata Method is TekRevol's AI-native delivery framework: explore fast with AI, cross the Ship Line only when the work meets production standard, and build in layers that make every next build better.

BRAND LINE

> Structured chaos, shipped in layers.

Five stages

Mode	Stage	AI does	Engineers own	Client gets
Explore	**1. Learn**	Reads existing code, data and documents. Sums up user and market signals	The problem, constraints and compliance needs	A problem brief and risk map
Explore	**2. Ideate**	Generates solution options and clickable prototypes	Choosing the direction and the architecture	An architecture decision and a chosen prototype
Explore	**3. Iterate**	Builds variations quickly for testing	Judging what works with real users	A validated prototype
Gate	**The Ship Line**	Runs automated checks against the Build Standard	Sign-off	A written go or no-go
Ship	**4. Incubate**	Writes and tests code in parallel	Reviewing every change. Security and compliance	A production release, layer by layer
Ship	**5. Scale**	Monitors performance, cost and model quality	Deciding what improves next	A performance review that feeds the next Learn

The loop: Scale feeds back into Learn. What each build teaches goes into the next one. That is "Better with every layer" as a working process.

Four principles

- **AI moves fast. Engineers own the decisions.**
- **Explore freely. Ship deliberately.**
- **Every layer is production-grade before the next goes on top.**
- **Every build makes the next one better.**

3. The Ship Line checks (the Build Standard)

The five Strata layers from the brand guidelines become the checklist at the Ship Line. Security and compliance run through every layer.

Layer	Checked at the Ship Line
5. Experience	Accessibility, usability tested
4. Product logic	Code reviewed, automated tests passing, architecture documented
3. AI	Model evaluated, human review where it matters, data kept private
2. Data	Data model, privacy by design, backups
1. Infrastructure	Monitoring, uptime targets, cost controls

Layer	Checked at the Ship Line
Through every layer	Security and compliance: encryption, least-privilege access, secure development lifecycle, experience with HIPAA, SOC 2, PCI DSS and GDPR

4. Accountability: who signs each gate

A framework only works if someone is answerable for it. Every gate has a named owner and a written sign-off, and the client sees the result.

Gate	Owner (answerable)	Signs off	Client sees
Learn, Ideate, Iterate	Project manager	Tech lead	The gate document (brief, decision, prototype)
The Ship Line	Tech lead	**CTO or a named delegate**	A written go or no-go against the Build Standard
Incubate (each release)	Project manager	Tech lead and QA	Release notes
Scale (review)	Project manager	CTO or delegate	Performance review

- Public line this enables: **"Every gate has a named owner and a written sign-off you can see."**
- Internally: one gate log per project, so leadership can see which gates were skipped

5. Why it sets TekRevol apart

- **It names the real problem with AI-built software** (great demos, fragile products) without blaming anyone. It reframes the prototype story: "You've explored. We help you cross the Ship Line."
- **It is visual and ownable.** Cyan field, orange line, stacked layers. The framework and the brand identity are the same thing
- **It has accountability built in.** Named owners and written sign-offs the client can see
- **It speaks to every buyer.** Founders get speed in Explore, approvers get the Ship Line, champions get a named method to take to leadership

How it shows up

HOMEPAGE SECTION: EYEBROW

> HOW WE WORK

H2

> The STRATA METHOD

LEAD

> AI makes exploring nearly free, while production still takes some engineering. Our method keeps the two apart, with one line between them.
